

Why IT Should Forget About Development

In a recent IT survey, almost 1,000 people shared how they were doing with application development and delivery, including managing requirements, development and releases. With core development processes having the highest quality score of all the processes, it's clear that IT organizations can "forget" about development. Instead, IT should spend more time focusing on requirements and release management in order to deliver what the business really wants.

Why You Should Streamline Your Overall Application Delivery Process

Application development is doing very well at most IT organizations. But those who coordinate how development works with the rest of IT can reduce rework by 6X and lower costs by 50%.

33% of development costs are wasted because of poor requirements, according to market research. Focusing on requirements can increase IT efficiency by 50% and accelerate delivery by 80%.

Automated release flow = maximized cash flow. By improving the release process, IT organizations can automate 90% of releases, release applications 85% faster and save 60% in IT resources.
